

# Strass (Tirolo) impianto a bilancio energetico in pareggio

24/05/2017

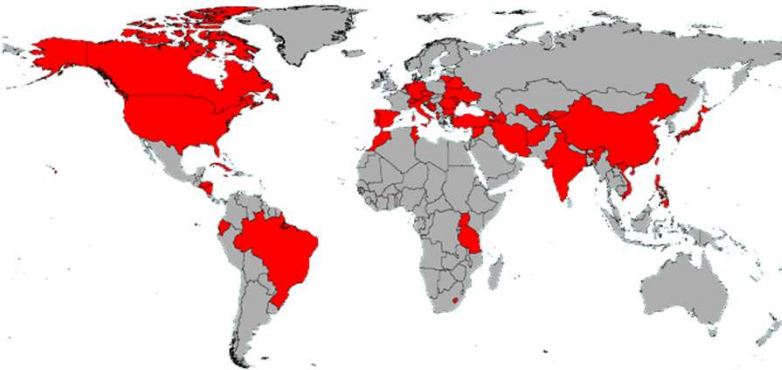

Martin Sulser

## IL NOSTRO TEAM

- SYNECO è un' azienda di consulenza per la promozione dello sviluppo sostenibile nei settori dell' **energia** e dell' **ambiente**
- TEAM interdisciplinare di 20 persone

## REFERENZE ED ESPERIENZE - REGIONALI/INTERNAZIONALI

Regione	Impianto	AE <sub>COD</sub>	kWh el.
<b>Tirol</b>	<b>Strass i Z.</b>	<b>140.774</b>	<b>3.302.054</b>
Tirol	Zirl	37.864	1.197.353
Tirol	Schwaz	40.068	1.228.982
Tirol	Innsbruck	272.494	6.975.734
Alto Adige	Passiria	9.647	375.885
Alto Adige	Glorenza	16.267	710.158
Alto Adige	Bassa V.Isarco	23.126	716.098
Alto Adige	Media Venosta	25.607	1.062.026
Alto Adige	Wasserfeld	27.711	934.521
Alto Adige	Bassa Pusteria	27.958	1.125.364
Alto Adige	Bressanone	49.448	1.935.427

Trentino	Rovereto	53.637	2.757.216

Strass (Tirol) impianto a bilancio energetico in pareggio

## Agenda

### **Case study – Strass (Tirolo): impianto a bilancio energetico in pareggio**

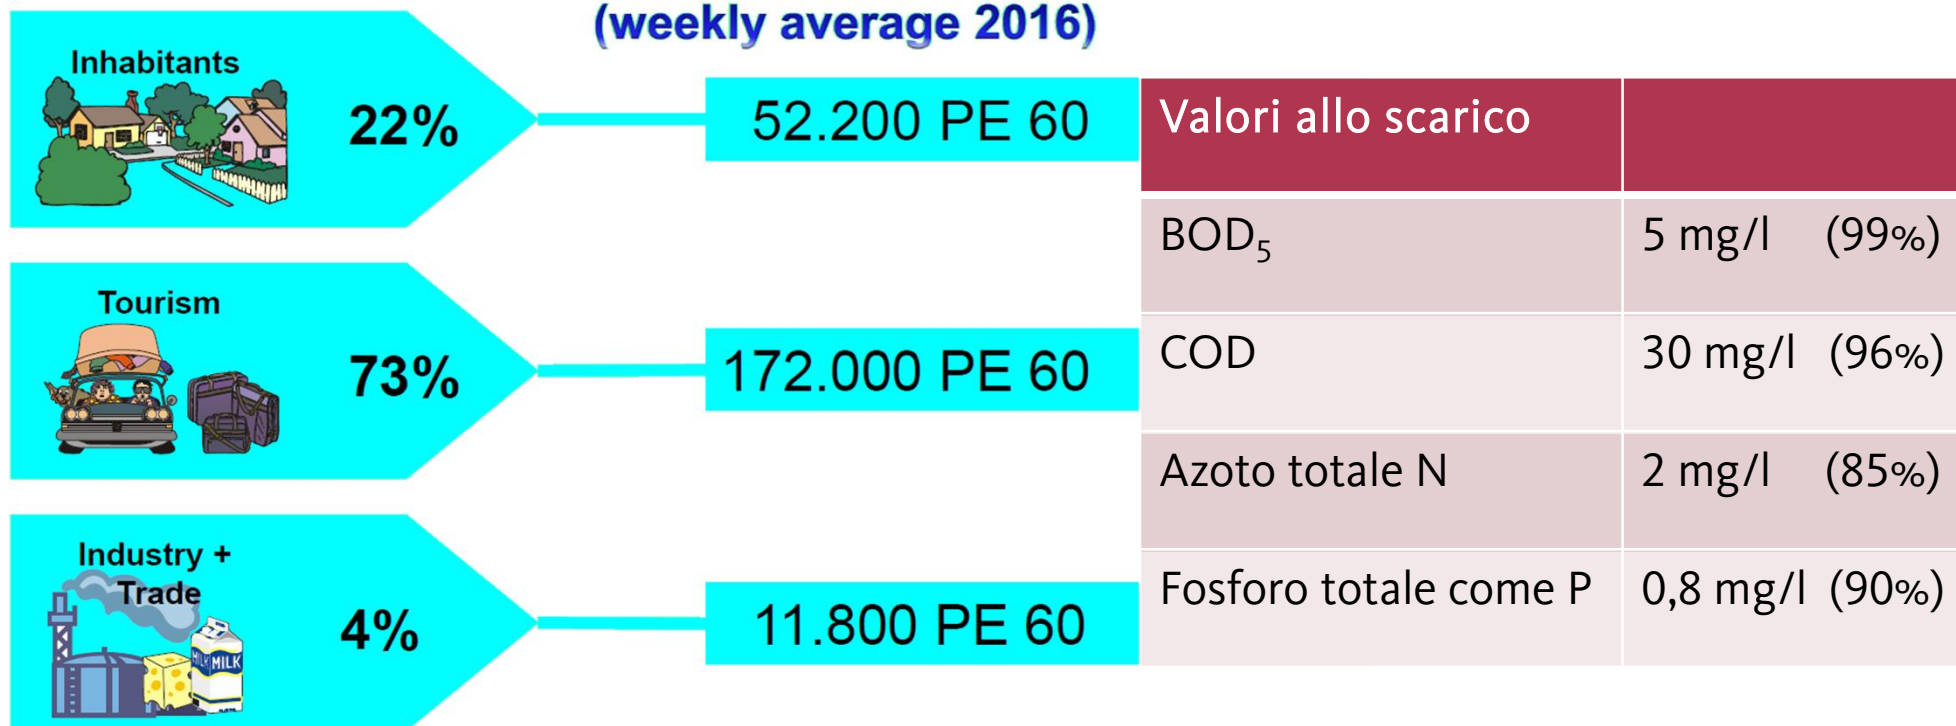

### **Tecnologie per raggiungere un bilancio energetico in pareggio**

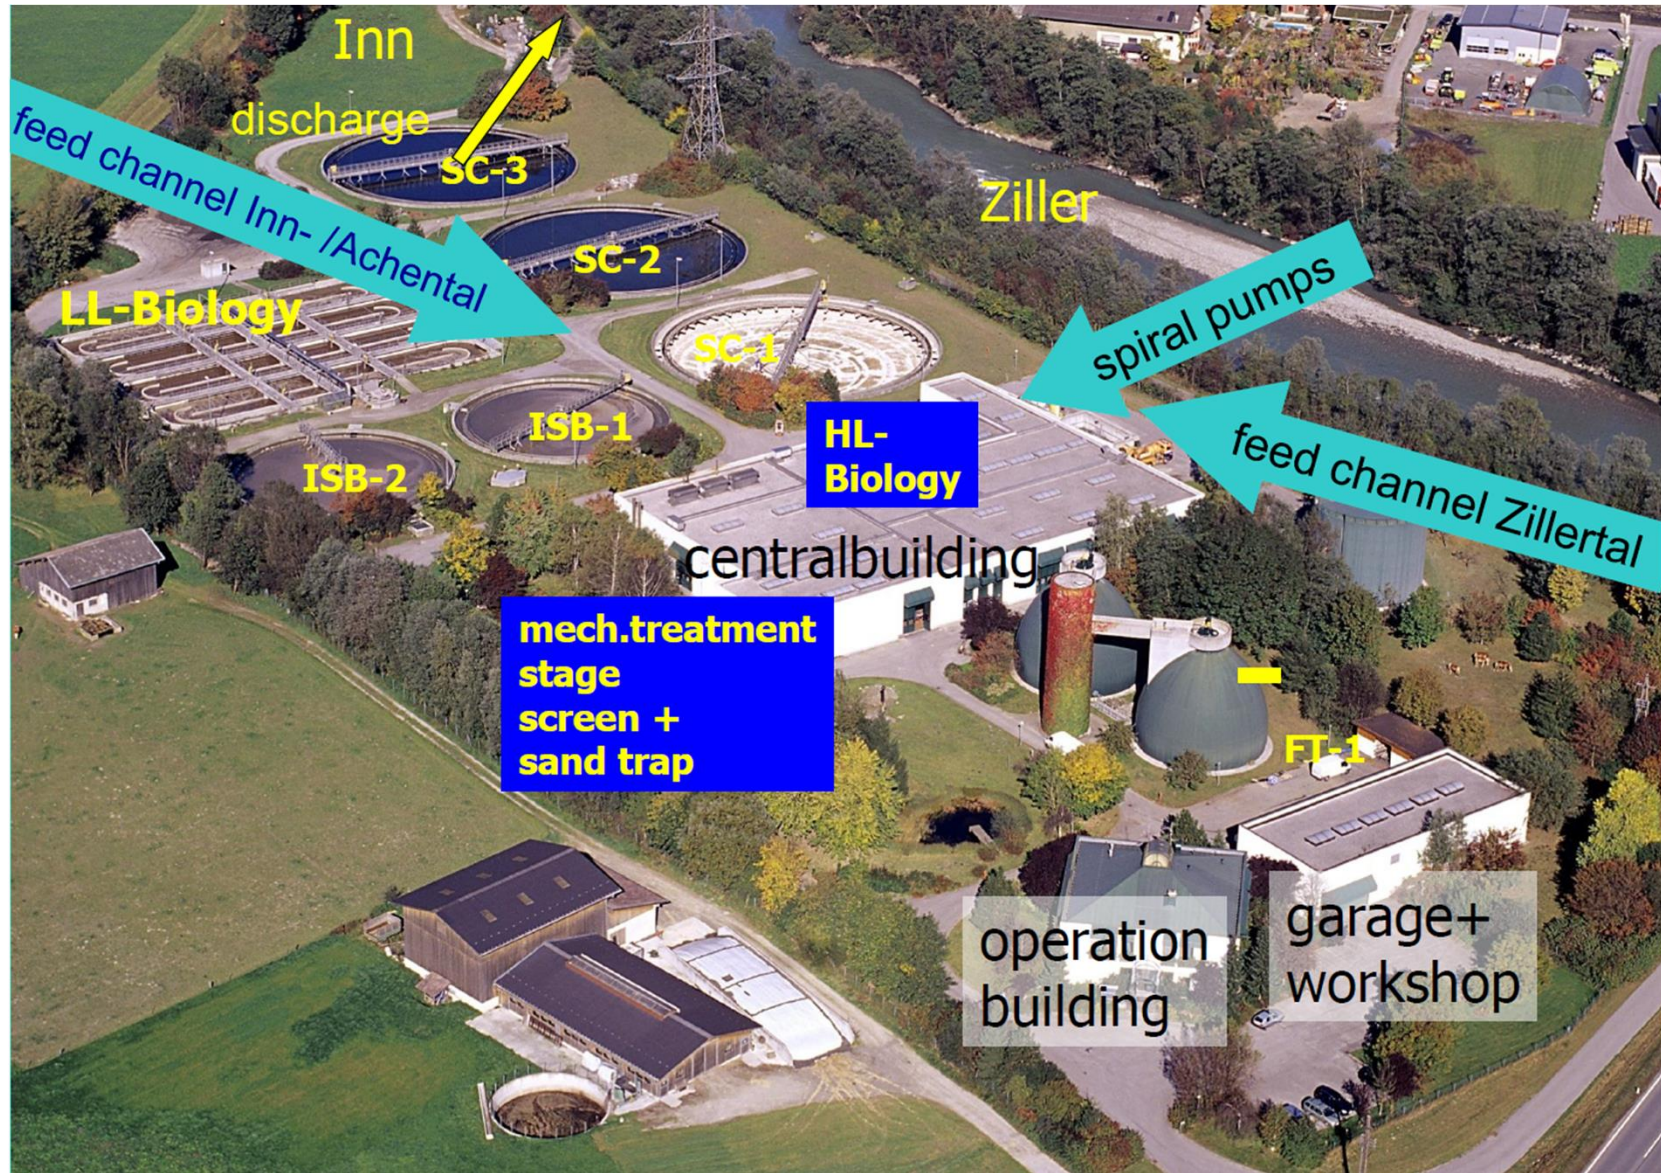

### **Obiettivi**

Waste water design capacity 167.000 PE<sub>60</sub>

according to adaptation project October 1997

maximum capacity 236.000 PE 60  
(weekly average 2016)

1. Mechanical Treatment Stage  
Screen and Screening Waste Clarifier

2. Mechanical Treatment Stage  
Sand trap and Grease trap

Mechanical Treatment Stage

Grit Washer

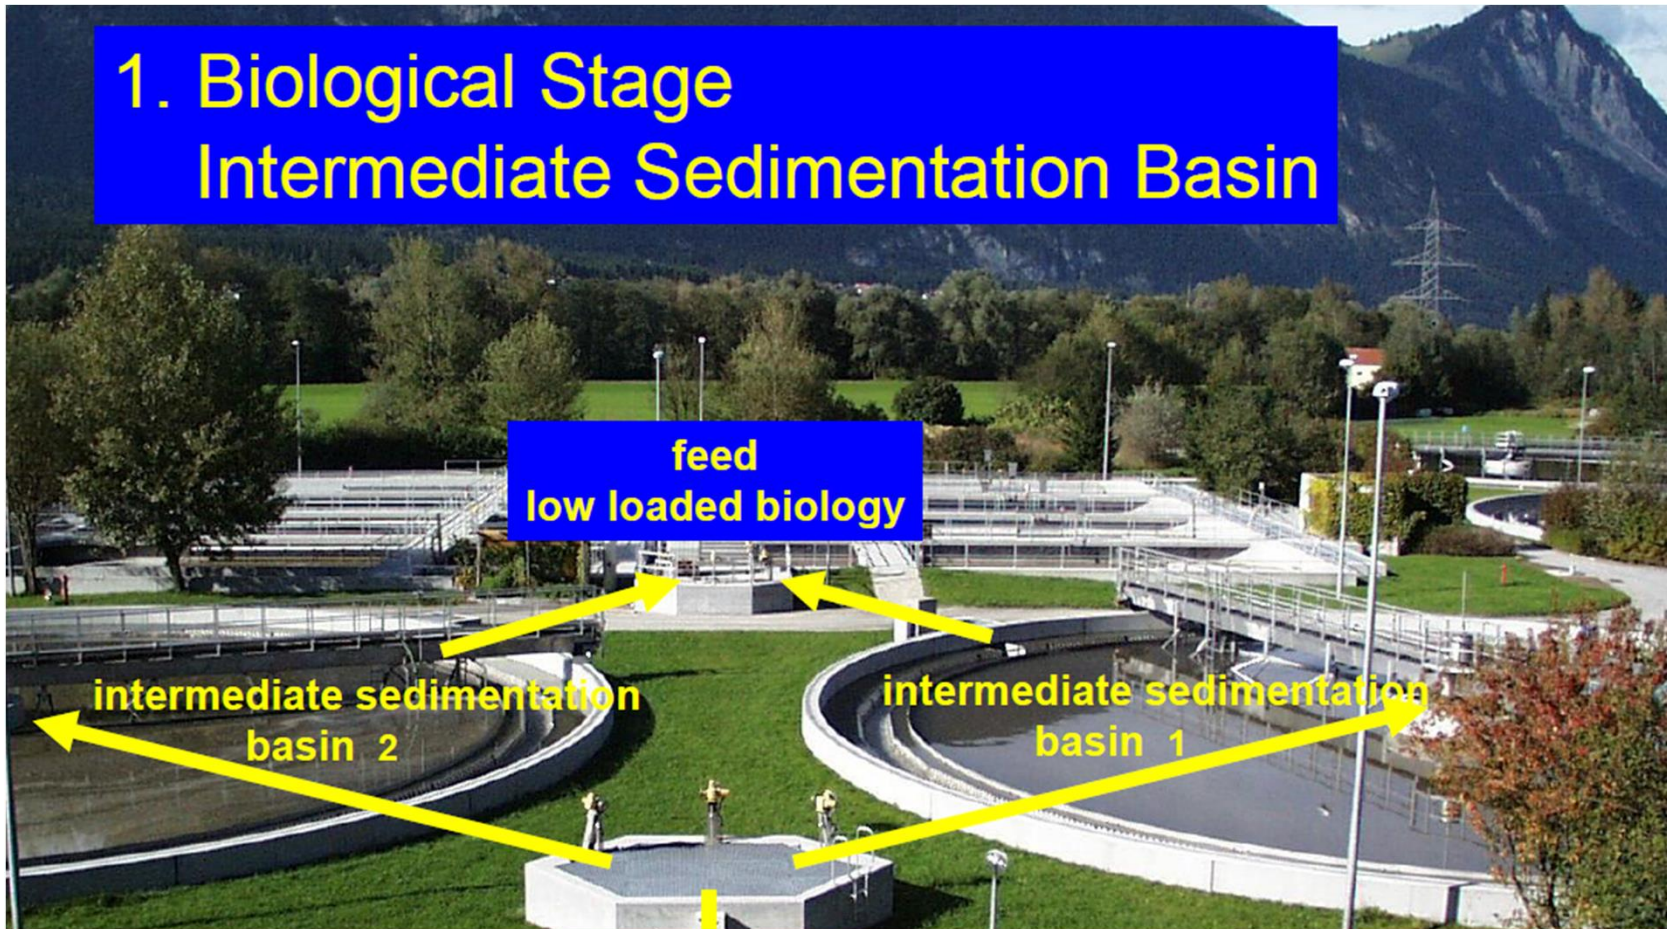

# 1. Biological Stage – High Loaded Biology

In the high loaded biology easily degradable carbon components are decomposed.  
This is only a partial clarification (approx. 50%)

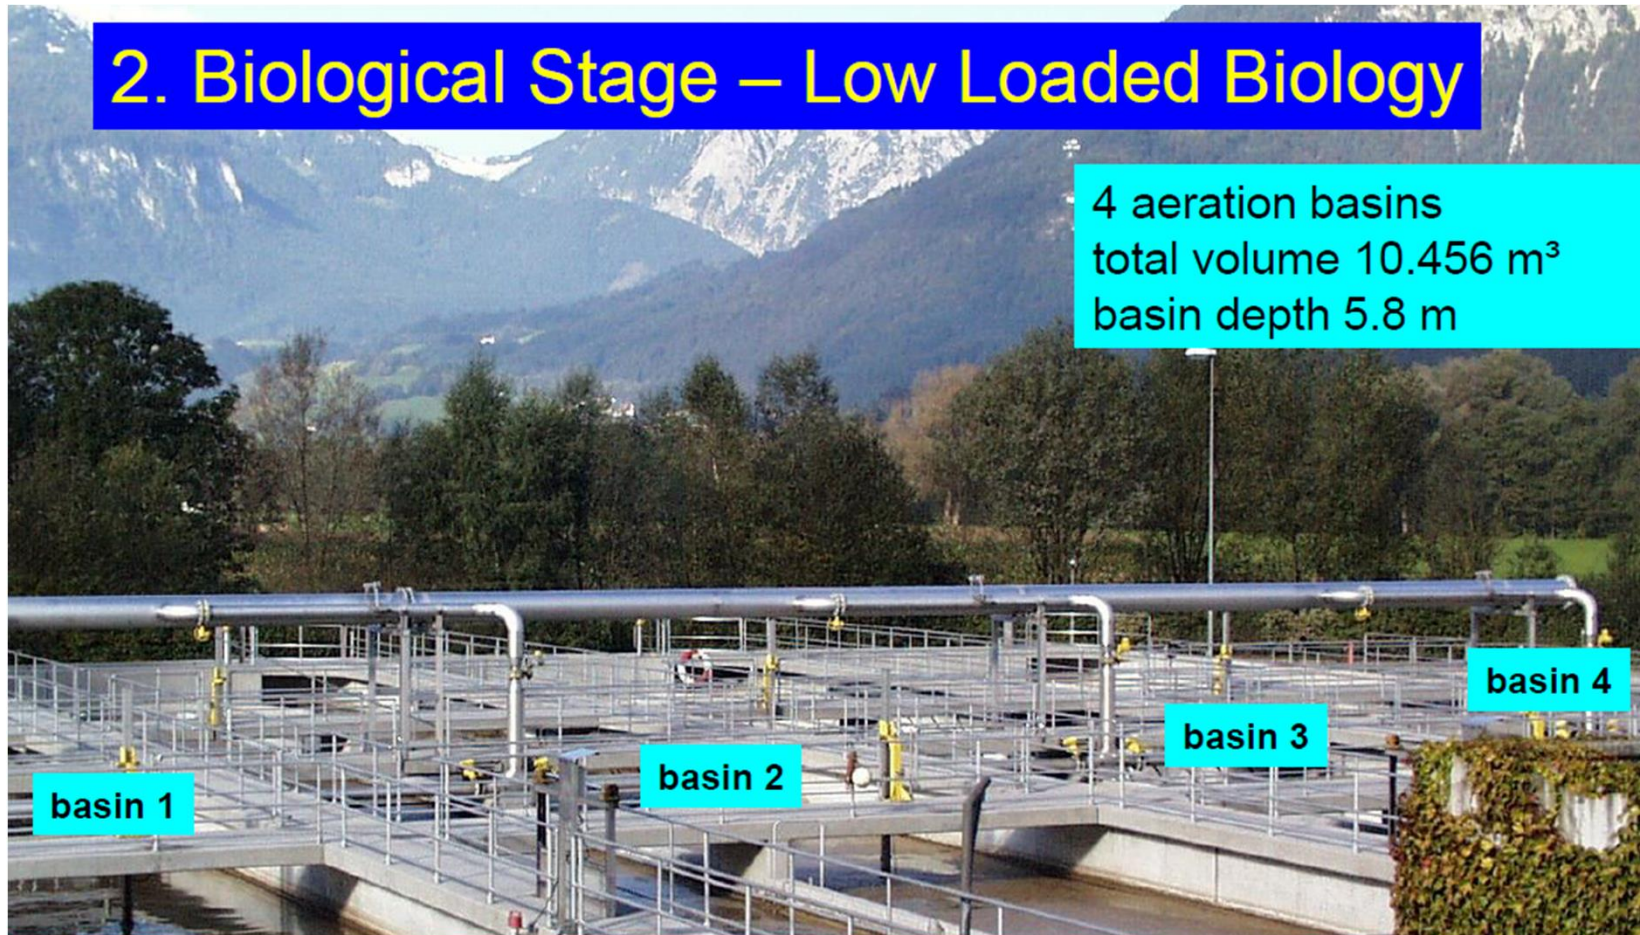

# 1. Biological Stage Intermediate Sedimentation Basin

The separation of the waste water – sludge mixture takes place in the intermediate sedimentation basin. To a large extent separated primary sludge is sent back again to the high loaded stage. The rest is led into sludge treatment.

## 2. Biological Stage – Low Loaded Biology

4 aeration basins  
total volume 10.456 m<sup>3</sup>  
basin depth 5.8 m

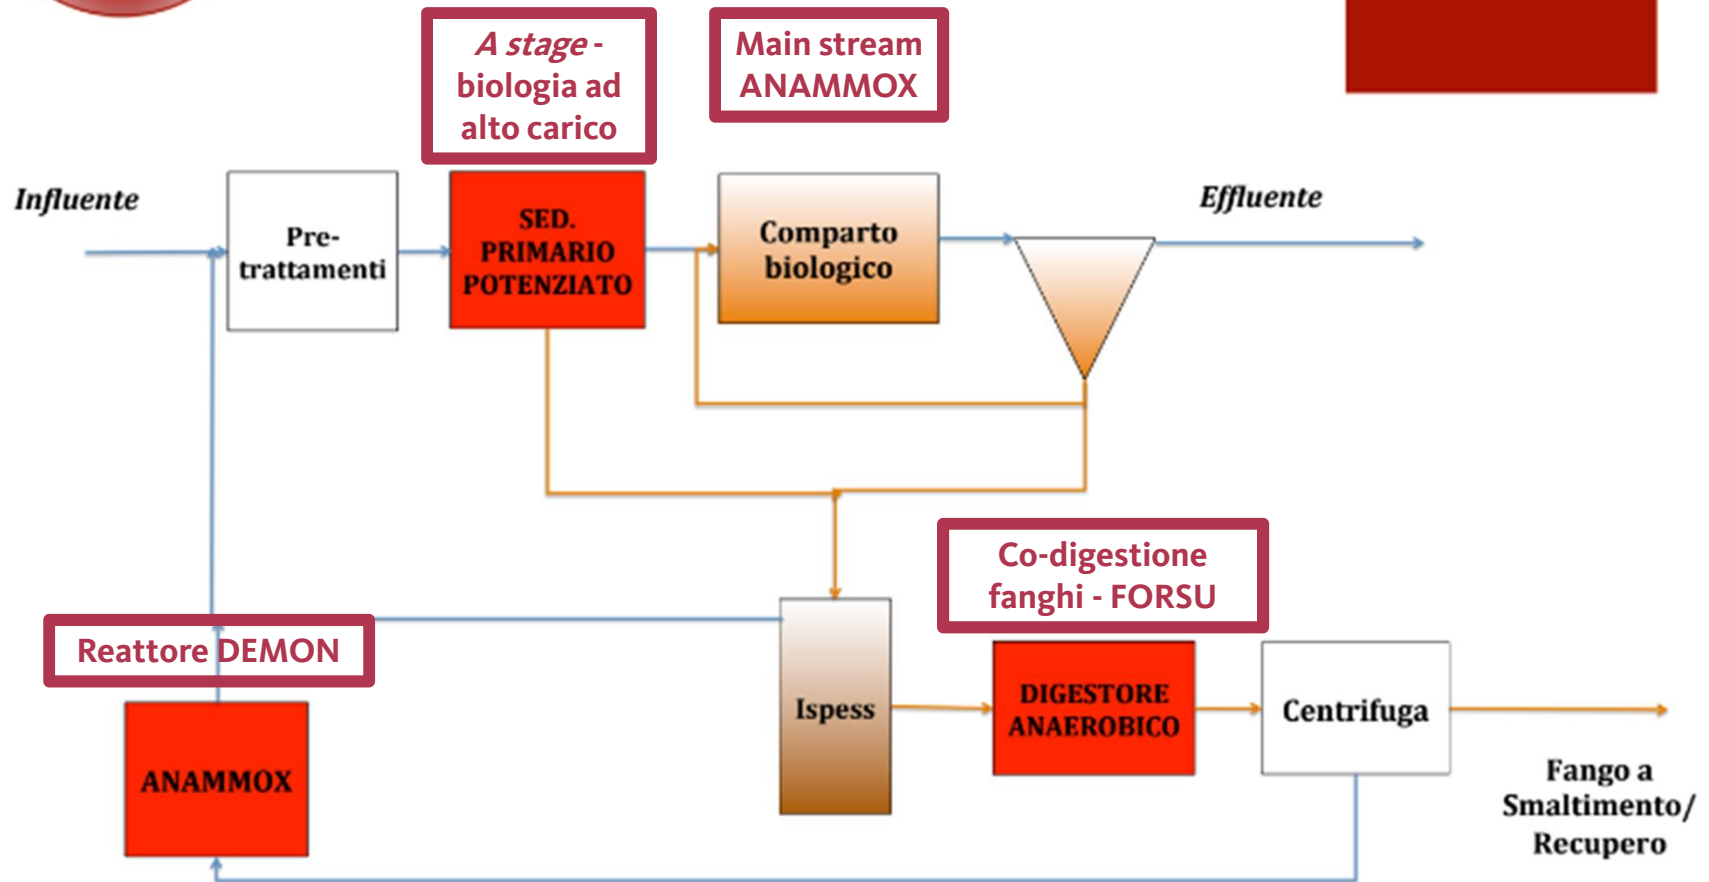

In the low loaded biology dissolved carbon components, as well as nitrogen – and phosphate compositions are decomposed. Therefore relatively large basin volumes and waiting periods are necessary.

Max.  
Energia

MA.RE.

# SCENARIO - 50,000 AE

# Energia elettrica

## Energia elettrica – produzione – immissione – consumo

GWh/anno

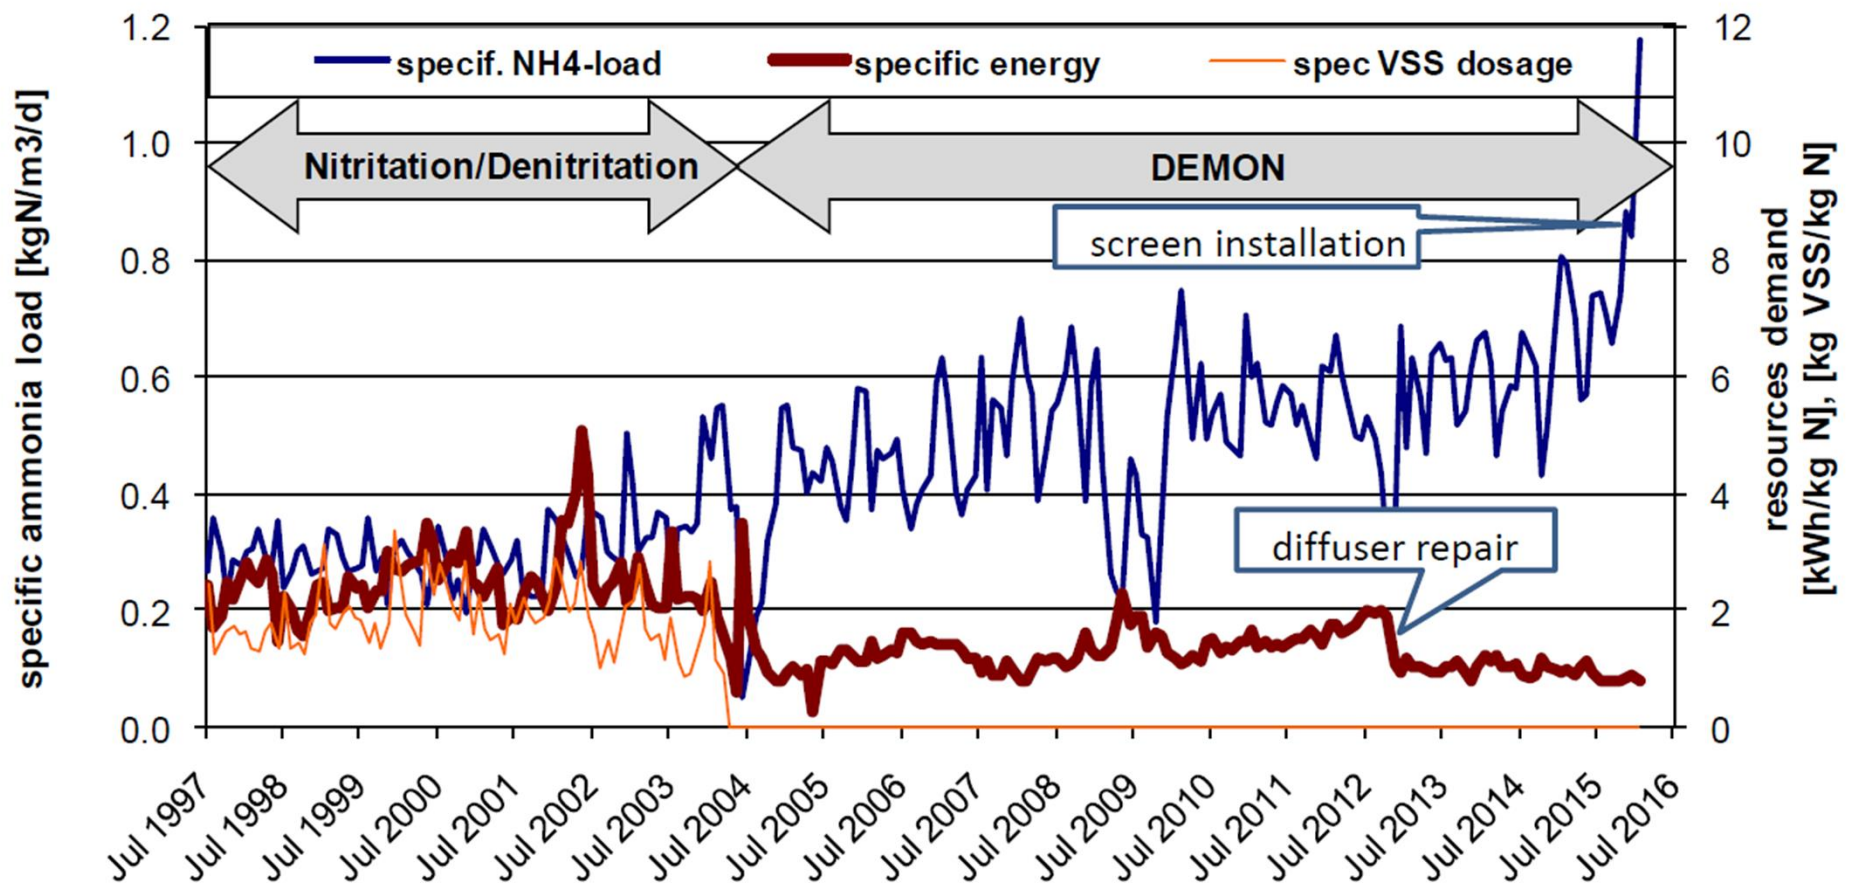

kWh/AE\*anno

**Consumo specifico:  
60 Wh/AE/d 22 kWh/AE/a**

**DEMON**  
**Cofermentazione**

## Consumo specifico rimozione azoto

## Agenda

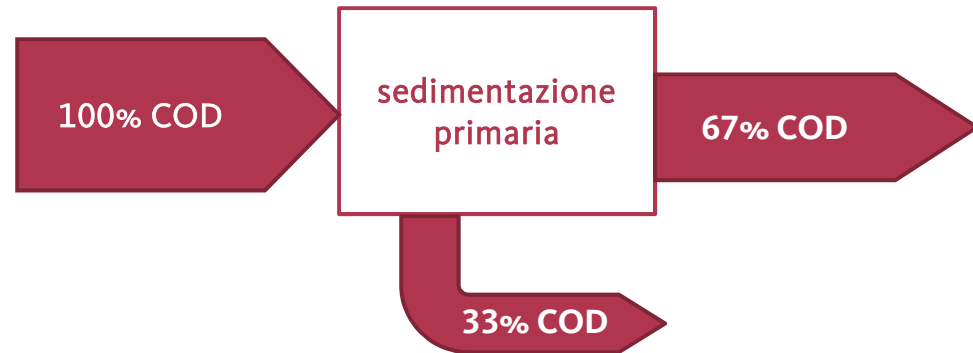

**Case study – Strass (Tirolo): impianto a bilancio energetico in pareggio**

**Tecnologie per raggiungere un bilancio energetico in pareggio**

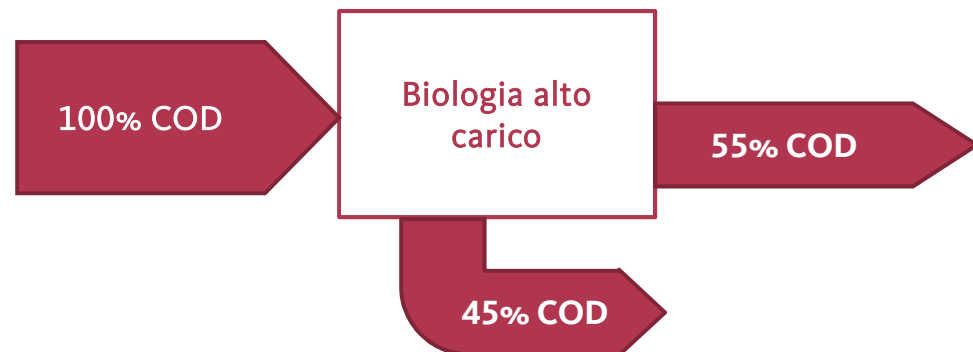

## Obiettivi

## A stage - biologia ad alto carico

- Sedimentazione primaria

- Biologia ad alto carico al posto delle sedimentazione primaria

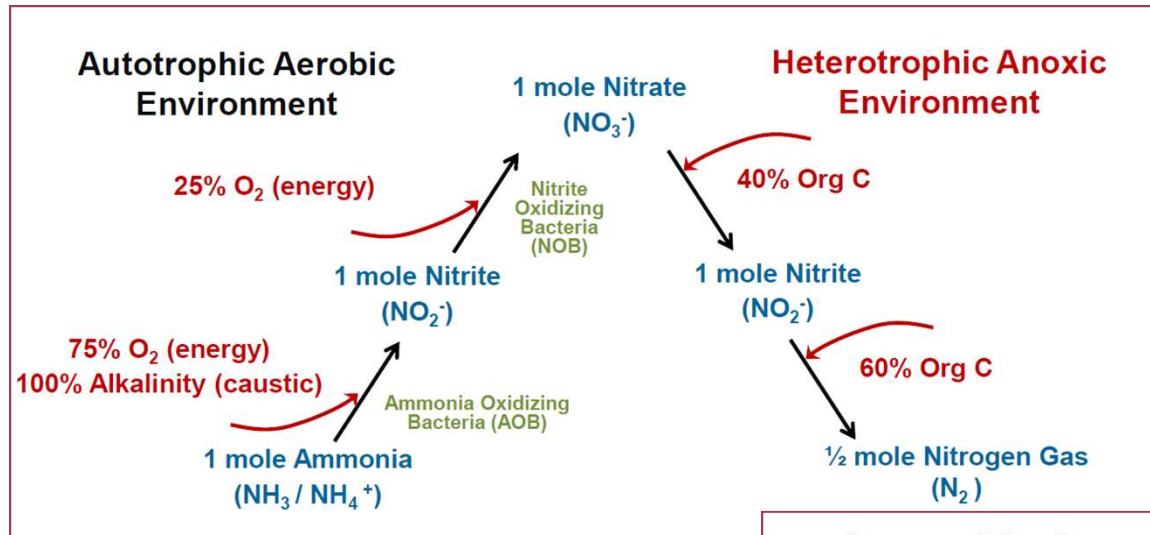

## *A stage* - biologia ad alto carico

- **Volume** vasca biologica ad alto carico **640 m<sup>3</sup>**
- Età fanghi molto ridotta (range **0,5-2 giorni**)
- **Aumento** produzione **biogas**
- **Variazione rapporto carbonio/azoto**
- Gestione/trattamento **odori**

# Anammox – Reattore DEMON

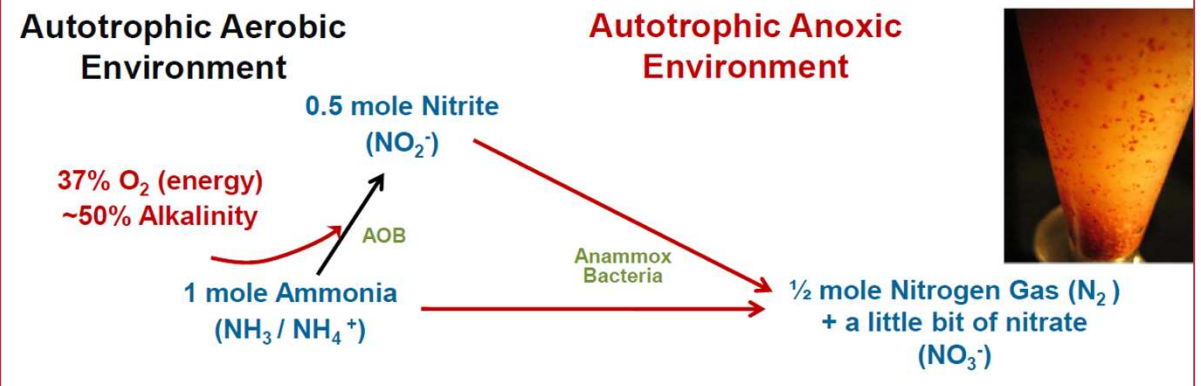

Mark W. Miller, 2015 VWEA Education Seminar, April 30th, 2015

## Potenziati vantaggi:

- Riduzione del consumo di ossigeno 63%
- Non necessita di un substrato organico (Riduzione consumo COD di quasi 100%)
- Riduzione della produzione di biomassa (80%)

## Anaerobic Ammonia Oxidizing Bacteria = Anammox

## Anammox – Reattore DEMON

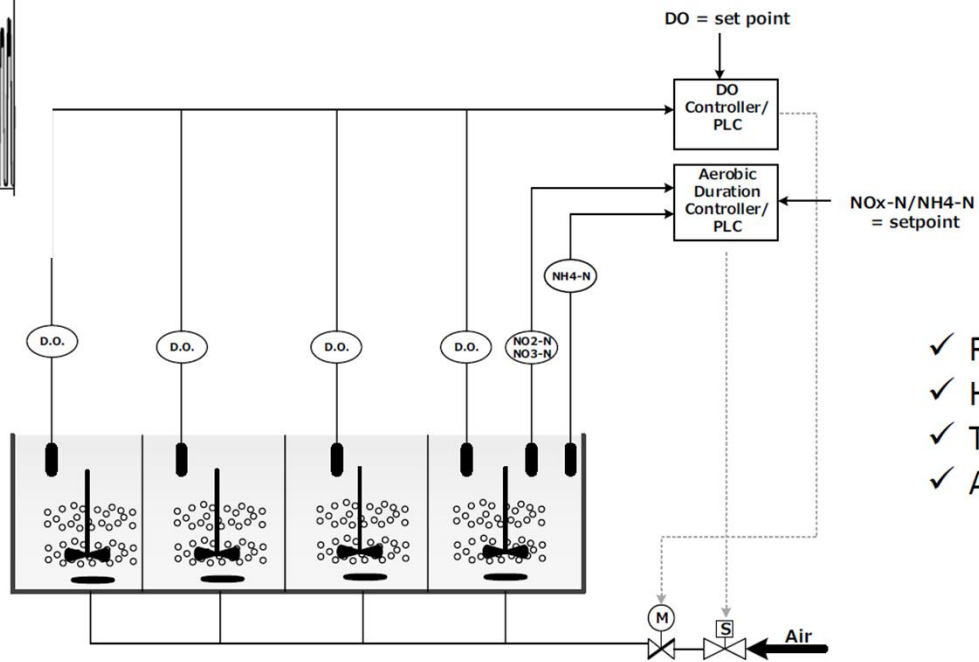

- Controllo dell'areazione attraverso il pH
- Sistema batch
- Ritenzione selettiva dei batteri  
Anammox con comparto grigliatura

# Controllo intelligente areazione (biologia a basso carico)

## AVN Aeration Control

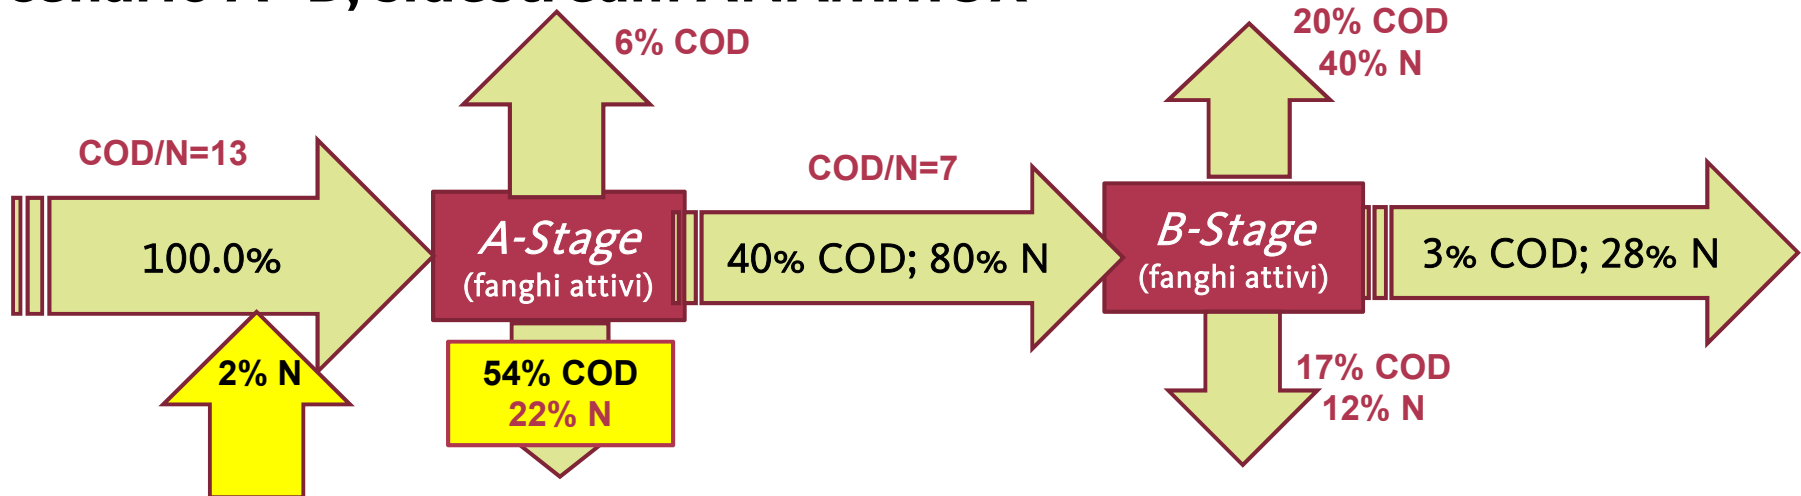

- ✓ Residual Ammonia
- ✓ High DO
- ✓ Transient Anoxia
- ✓ Aerobic SRT control

## Scenario convenzionale Sed. primaria, comparto biologico

## Scenario A+B, sidestream ANAMMOX

## Anammox nel comparto biologico principale

Uno dei **primi depuratori al mondo** che intende sfruttare i vantaggi del processo ANAMMOX anche nel comparto biologico principale (main stream).

**Trasferimento della biomassa ANAMMOX** (side stream to main stream)

Nuove Sfide:

- **Competizione** dei batteri **ANAMMOX** nei confronti dei **batteri nitrificanti**
- **Temperature basse; lunghi tempi di duplicazione**
- **Ritenzione** dei batteri ANAMMOX
- **rapporto carbonio/azoto** più alto → biomassa eterotrofica va a sostituire la biomassa autotrofa

**MLSS**

**screen pass-through**

**screen retained**

## Agenda

**Case study – Strass (Tirolo): impianto a bilancio energetico in pareggio**

**Tecnologie per raggiungere un bilancio energetico in pareggio**

## Obiettivi

## Insieme verso il futuro ottimizzando il presente

Assieme ai nostri clienti portiamo i depuratori verso un consumo specifico di **55 Wh/AE/d** o **20 kWh/AE/a**

Aumentiamo la produzione di energia elettrica tramite biogas fino ad un **grado di autonomia del 100%**
